The research problem: credible evidence first

Research question

Who is positioned to benefit from AI in Cabo Verde's public administration — and who may be left behind?

Immediate challenge

- Research evidence is dispersed across official PDF reports.
- Extracted indicators need accurate values, units, years and provenance.
- Uncertain or conflicting information requires human review.

Intended users

Public policy researchers and analysts who need verifiable, reproducible evidence.

Project premise: a reliable evidence-processing PoC, not an AI impact study.

A small Agentic Evidence Research Assistant

Proposed proof of concept (PoC)

One goal-directed agent selects evidence actions, uses local tools, checks for gaps or conflicts, records decisions, and escalates uncertain cases.

01

Select

Choose relevant source passages and next evidence action.

02

Verify

Call extraction / validation tools; flag contradictions.

03

Record

Store values, source pages and review status.

04

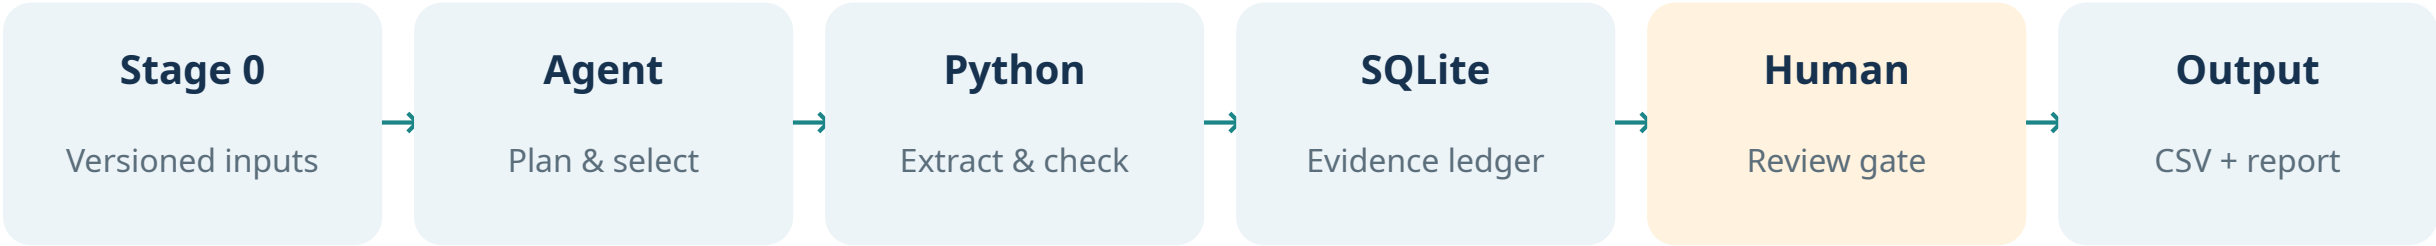

Escalate

Stop for human approval before accepting uncertain claims.

Bounded autonomy: agent decisions are auditable; human approval remains mandatory.

APPROACH

Architecture and initial evidence sources

Initial evidence

INE Cabo Verde ODS 2015–2025 report: 20–30 deliberately selected observations, across 2–3 indicators.

Conceptual context

World Bank World Development Report 2026; not a source of Cabo Verde employee-level records.

Minimum ledger fields: source + page • indicator • year • geography • value • unit • extraction method • review status

A deliberately constrained and safe PoC

IN SCOPE

20–30 manually checked observations; structured evidence ledger; source/page traceability; reproducible local tests.

OUT OF SCOPE

No national workforce estimates, employment forecasts, confidential employee records, live government systems or autonomous publication.

Key risks → corresponding safeguards

PDF extraction errors	→	Manual gold set + numeric/unit/year checks
Missing or invented values	→	Explicit missing status + mandatory source/page
Conflicts / prompt injection	→	Flag, isolate and escalate to a reviewer
API cost and scope creep	→	Cost cap + fixed test set + read-only files

Four-week plan and measurable success

W1 Frame

Approve inputs, 2–3 indicators, gold set + schema

W2 Baseline

Deterministic Python extraction + SQLite

W3 Agent

Tool use, audit trail + human review queue

W4 Evaluate

Compare both methods; demo + go/no-go

Proposed acceptance targets

≥95%	Exact value / unit / year match vs. checked gold set
100%	Approved records traceable to source and page
All	Seeded missing/conflicting cases flagged for review
Compare	Time, errors, interventions and API cost vs. Python baseline

Decision requested: approve PoC scope, evaluation priority and deferral of workforce exposure analysis.
